

BETONIQ WEST LTD

Full Self-Sufficiency Manual — All Platforms

Purpose: every platform/account the agent has touched for BETONIQ WEST LTD / ZeroPâ■ Money, written so Tom can navigate and operate each one directly, without any assistant involvement, if needed.

1. GitHub — github.com/TOMDEGGS/BETONIQ-WEST-

Single source of truth for every HTML demo, PDF, white paper, and markdown file.

1. Log in at github.com with the TOMDEGGS account (linked to betoniqwestltd@gmail.com).
2. Open the repo:
github.com/TOMDEGGS/BETONIQ-WEST-
3. Edit an existing file: open it, click the pencil icon top-right, make the change, scroll down, write a commit message, click "Commit changes." No command line needed.
4. Add a new file: "Add file" then "Upload files," drag it in, commit.

5. Shareable link to any file: open it, click "Raw," copy the URL — that's the raw.githubusercontent.com format used everywhere.
6. For HTML demo pages: a raw link just shows code. To make it open as a real webpage, prefix it: `htmlpreview.github.io/?[raw link]`.
7. Command-line git (bulk changes): Settings, Developer settings, Personal access tokens, generate one, use as the password when git prompts. Rarely needed.

2. Netlify — netlify.com

Hosts the live public websites.

1. Log in with `betoniqwestltd@gmail.com`.
2. Live sites: primary website (`zeropay-betoniqwest.netlify.app`) and Master Hub launcher (`betoniqwestmasterhublivedemos.netlify.app`).
3. Click a site, "Deploys" tab shows every published version.
4. Update a site: (a) if linked to GitHub, any file change there auto-redeploys; (b) manual — drag a folder onto the Deploys page.
5. Custom domains under "Domain management" on the site's page.

6. Cost caution: roughly 100 free build credits remain across all sites combined — do not redeploy unless genuinely necessary.

3. Twilio — console.twilio.com

Would carry WhatsApp messages to the backup AI agent if Base44 goes down.

1. Log in at console.twilio.com.
2. Account SID: visible on the Console dashboard homepage (starts "AC..."). The Auth Token next to it IS a real secret — never share it.
3. Find WhatsApp settings: Messaging, Try it out, Send a WhatsApp message (sandbox), or Messaging, Senders, WhatsApp senders.
4. Critical field: "When a message comes in" (the webhook). Paste in: <https://betoniqwest-ai-agent-777-c4728734.base44.app/functions/whatsappBackupAgent> — method POST, save.
5. Test by messaging the Twilio number directly on WhatsApp.

4. Zoho Mail & Zoho Domains — mail.zoho.com

Business email and the zeropay.site domain both live here.

1. Log in at mail.zoho.com with zeropointfeild_nonwnt@zeropay.site (the official business email for all comms).
2. Domain management: accounts.zoho.com or the Zoho Domains section — where zeropay.site is registered and DNS is configured.
3. IMAP/SMTP settings: Zoho Mail Settings, Mail Accounts, IMAP Access must be enabled, and a dedicated App Password generated under Security, App Passwords, for any third-party tool to connect. IMAP host: imappro.zoho.com, port 993, SSL.
4. If automated email checks fail (as they currently are), check first whether that App Password is still valid — it is separate from the normal login password and can expire.

5. Gmail — gmail.com

Personal/business Google account:
betoniqwestltd@gmail.com.

1. This account is the login for Netlify, and for Gemini (backup AI).
2. Connected apps/security: myaccount.google.com, Security tab.

3. This inbox now holds a copy of every document the agent has emailed, including this manual.

6. Gemini (Backup AI, read-only) — gemini.google.com

Fallback AI if Base44 is fully unavailable — reads context but can't take real actions.

1. Go to gemini.google.com, sign in with betoniqwestltd@gmail.com.
2. Paste the Master Briefing Document (exported company knowledge file) or its link.
3. Say: "You are now Tom's AI agent for ZeroPay. Read this briefing and confirm you understand."
4. Gemini becomes conversationally useful within about a minute, but cannot send emails, touch GitHub, or take real actions.

7. WhatsApp Backup Agent (action-taking)

The real backup — a deployed Base44 function running OpenAI's gpt-4o-mini, with its own persistent memory.

1. Endpoint: <https://betoniqwest-ai-agent-777-c4728734.base44.app/functions/whatsappBackupAgent>

2. Once the Twilio webhook (section 3) points at this URL, WhatsApp messages get automatic replies — no manual step after setup.

3. It remembers conversation history but cannot send emails, files, or perform real external actions.

8. Paystack — dashboard.paystack.com

Payments/settlement rail partner.

1. Log in at dashboard.paystack.com with the merchant account credentials.

2. Main contact for account issues:
channelpartnerships@paystack.com.

3. Live-mode activation status and compliance approvals show up in the registered Zoho inbox — that's what the Paystack Live Mode Monitor automation watches for.

9. OpenAI Platform — platform.openai.com

Powers the WhatsApp Backup Agent's intelligence.

1. The API key currently used is stored securely as a Base44 secret, not something you need to touch day-to-day.

2. To see usage/billing or rotate the key:
platform.openai.com, API keys section, generate a new key, then update wherever the backend expects it.

10. LinkedIn — linkedin.com

Primary channel for named-contact investor outreach.

1. Log in with the personal LinkedIn account.
2. Connection requests and messages to VCs go out from here — drafts are prepared in outreach packets, you copy-paste and send.

11. X (Twitter) — x.com

Public channel for investor challenge posts.

1. Log in with the account used for BETONIQ/ZeroPay public posts.
2. Post drafts are prepared in outreach packets; you copy-paste and post directly.

12. Base44 itself — app.base44.com

Even while the platform is running, some things can be managed directly rather than through the agent.

1. Billing/subscription: account or workspace settings inside app.base44.com — where the Enterprise E2

payment and plan changes are handled, alongside direct conversations with Jenny Rivero (Account Manager).

2. This chat interface lives here too — bookmark <https://app.base44.com/superagent/69c1064318031a63c4728734> as the direct link back to this agent.

Summary

If Base44 is ever unavailable: GitHub holds every file, Netlify serves the live public sites, Zoho carries the business email, and Twilio plus the WhatsApp Backup Agent keeps a working AI conversation going. Gemini is the read-only fallback if even the backup agent's hosting goes down. Paystack, LinkedIn, and X are external accounts operated manually regardless. All of these are things you can log into and use directly through their own web dashboards — no developer skills required.
