Agent Zero Self-Hosted AI Clone — Setup Checklist (Deferred Task)

Prepared for: Tom Ugboaga, Shareholder & CEO

Status: DOCUMENTED, NOT YET BUILT — execute once revenue lands

Date: August 23, 2026

Why This Exists

This is the third and deepest layer of AI-agent redundancy for BETONIQ WEST LTD / ZerôPâ■ Money, beyond the primary Base44 agent and the Gemini conversational clone. Agent Zero is an open-source agent framework (github.com/agent0ai/agent-zero) that gives an AI real "hands" — a terminal, browser, and code execution — not just conversation. Once wired up, it can write files, run git commands, and push to GitHub on its own, the same way the primary agent does today.

Why It Is Deferred

Per standing instruction, no non-critical spend is authorised while cash flow is tight. A genuinely free setup is possible (own laptop + Docker + a free local model via Ollama, \$0 total cost) but still requires real time to configure and a reasonably capable machine. This is not urgent while the Gemini clone

already covers the "Base44 is fully gone" scenario for conversation and strategic thinking.

What It Needs (when you're ready)

1. A machine to run it on

Your own laptop (free) or a small VPS (paid, e.g. ~\$5-6/month DigitalOcean/Hetzner) if you want it always-on rather than only when your laptop is open.

2. Docker installed

Agent Zero runs inside a Docker container. Free, one-time install: docker.com/get-started.

3. An LLM to drive its reasoning

Free route: Ollama running a local model (e.g. Llama 3) — \$0 cost, but noticeably less sharp than GPT-4/Claude-class reasoning. Paid route: OpenAI or Anthropic API key — sharper output, billed per use.

4. A GitHub Personal Access Token

Generate at github.com/settings/tokens (repo scope only). This is what lets Agent Zero authenticate git pushes to TOMDEGGS/BETONIQ-WEST- on your behalf.

5. The clone identity file

Feed it AGENT_CLONE_777.md (already live on GitHub) as its system prompt/instructions so it inherits the same personality, rules, and company knowledge as the primary

agent and the Gemini clone.

Setup Steps (once approved to proceed)

1. Install Docker Desktop (or Docker Engine on a VPS).
2. Clone the Agent Zero repo: `git clone https://github.com/agent0ai/agent-zero`
3. Follow the repo's docker-compose quick-start to launch the container.
4. Open its web UI (runs locally, typically `http://localhost:50001`).
5. Paste AGENT_CLONE_777.md content into its system prompt / persona settings.
6. Connect either Ollama (free local model) or an API key (OpenAI/Anthropic) as its reasoning engine.
7. Store the GitHub Personal Access Token in its settings/secrets so it can run `git push` on request.
8. Test with a simple task: "write a one-line README update and push it to the repo" — confirm it completes end to end.

Cost Summary

Component	Free Option	Paid Option
Hosting	Own laptop (\$0)	VPS (~\$5-6/mo)
Software	Agent Zero (open source, \$0)	Same, \$0 either way
LLM brain	Ollama local model (\$0)	OpenAI/Anthropic API (usage-based)

Bottom line: the fully free path (own laptop + Ollama) is genuinely \$0, just slower/less sharp reasoning. Recommended trigger to build this: once first revenue lands.
