Prepared for grant, government, and institutional review

Executive Summary

CivicTrack is a Zeropay Digital Services Ltd venture (UK subsidiary of BETONIQ WEST LTD) —
Transparent digital tracking for public service applications.

Key statistic: Corruption is estimated to drain over \$3.6 trillion from the global economy every year (UNODC), much of it extracted through delay and informal 'facilitation fees' in basic public services.

Problem Statement

Citizens applying for permits, identity documents, and licenses frequently face undocumented delay, creating the exact conditions in which informal payment is solicited to 'speed up' a process. Without a visible, timestamped status trail, there is no accountability mechanism for either the citizen or the reviewing officer.

Technical Architecture

- Every submission generates an immutable, timestamped reference number visible to the applicant instantly.
- Agency-side dashboard restricts status changes to authenticated staff, each change hash-chained to the prior state for tamper evidence.
- Aggregate average-processing-time analytics published per service type and per agency, creating public accountability pressure.
- SMS/USSD status-check fallback for applicants without smartphone access.

Core Data Model

Entity	Purpose
Applicant	Citizen identity, submitted requests, contact channel.
ServiceRequest	Request type, reference number, current status, submission date.
Agency	Government department/office handling a request type.
StatusUpdate	Timestamped state change, responsible officer, optional note.

Security, Privacy & Compliance

- Hash-chained status history makes retroactive tampering with the audit trail detectable.
- Officer-level access logging tied to individual staff accounts, not shared logins.
- Citizen data handled under data-minimization principles appropriate to public-sector deployments.

Feasibility & Build Status

Data model and status-tracking workflow specified.
Reference architecture built independently of
Base44 on GitHub and deployed live on Hugging
Face Spaces, deployable to any government IT
environment without vendor lock-in.

Market Opportunity

GovTech spend forecast to exceed \$1 trillion globally by 2030 (World Bank). Target beachhead: state-level permit/licensing agencies in Nigeria.

Grant & Funder Fit

Directly aligned to GovTech and anti-corruption funding lines: World Bank GovTech Global Partnership, Open Government Partnership grants, EU Digital Europe Programme, and USAID/DFID public-sector digitization funds.

Funding Ask

\$120,000 pilot grant for one state-level agency deployment (permits + ID renewal), 12 months.
